Moving to multiple Eves

We should be able to work with different contexts.

So:

1) Be able to create 2 different configs

2) Each config allows own setup and has a separate folder for storing configs, images, distros

3) Eve certs and images are associated with Eve name property. Adam also uses this property if set or generates eve name if absent. We can list eve by name. Name is enough to reference eve within one config.

4) At one time only one config can be active

5) Tests read info from active config and use eve names

6) Adam config works with all configs specified. Eve names within configs should be different.
