LF Edge is an umbrella organization that aims to establish an open, interoperable framework for edge computing independent of hardware, silicon, cloud, or operating system. By bringing together industry leaders, LF Edge will create a common framework for hardware and software standards and best practices critical to sustaining current and future generations of IoT and edge devices.

We are fostering collaboration and innovation across the multiple industries including industrial manufacturing, cities and government, energy, transportation, retail, home and building automation, automotive, logistics and health care — all of which stand to be transformed by edge computing.

**Project Alvarium**

Initiated by Dell Technologies, Project Alvarium aims to build a framework and SDK for trust fabrics that ensure data from devices to applications with measurable confidence. Trust fabrics employ a system-wide approach by integrating trust insertion technologies spanning from silicon to cloud, which will introduce a new era of business models and customer experiences driven by interconnected ecosystems. Initial contributing companies include Dell, the IOTA Foundation, Intel, Arm, VMware, and ZEDEDA.

**Baetyl**

Pronounced "Beetle", Baetyl is a general-purpose platform for edge computing that manipulates various hardware facilities and device capabilities into a standardized container runtime environment and API, facilitating the efficient management of application, service, and data flow through a remote console on both cloud and on-prem. Baetyl also provides the edge operating system with the appropriate toolchain support, reduces the complexity of developing edge calculations with a set of built-in services and APIs, and plans to introduce a graphical IDE in the future.

EdgeX Foundry

EdgeX, your data liberated! Highly flexible open source software framework that facilitates interoperability between heterogeneous devices and applications at the IoT Edge, along with a consistent foundation for security and manageability regardless of use case.

The open, vendor-neutral platform speeds developer and technology providers time to market by providing modular reference services for device-data ingestion, normalization, analysis and sharing in support of new IoT data services and advanced edge computing applications.

STAGE 3: IMPACT

Mail Lists

eKuiper

eKuiper is an edge lightweight IoT data analytics/streaming software implemented by Golang, and it can be run at all kinds of resource-constrained edge devices. One goal of eKuiper is to migrate the cloud streaming software frameworks (such as Apache Spark, Apache Storm and Apache Flink) to the edge side. eKuiper helps to bring computation closer to where data is generating, with an introduced rule engine to enable streaming applications on the edge side.

STAGE 1: AT LARGE

Mail Lists

EVE

An open abstraction engine that simplifies the development, orchestration and security of cloud-native applications on distributed edge hardware. Supporting containers, VMs and unikernels, EVE provides a flexible foundation for Industrial and Enterprise IoT edge deployments with choice of hardware, applications and clouds.

STAGE 2: GROWTH

<table>
<thead>
<tr>
<th><strong>Fledge</strong></th>
<th><strong>STAGE 2: GROWTH</strong></th>
<th><strong>Fledge</strong> is an open source framework and community for the industrial Edge. Architected for rapid integration of any IIoT device, sensor or machine all using a common set of application, management and security REST APIs with existing industrial “brown field” systems and clouds. Fledge edge services include: Collect Data from any/all sensors, aggregate/combine/organize data. Edge based alerting/anomaly detection/machine learning (TensorflowLite, OpenVino), transform/filter data in flight, buffer data, analyze/visualize edge data, and deliver data to multiple local/cloud destinations.</th>
