

Tutorials/Getting Started

Most of our documentation for how to get started is on our github pages for [EVE](#) and [Eden](#), but we wanted to pull a couple out and highlight them a little bit more. This could be because the builds are a little different or we figure that more people who are just getting started with Project EVE are more likely to use these.

If you have questions or you have done something cool that we can share, please reach out to us on our slack channel for [EVE](#). We also have channels for help ([#eve-help](#))

Raspberry Pi-

Tutorials that focus on everyone's favorite small SOC boards. We are working on improving the set up and virtualization of the hardware, but we wanted to get these out there so you could start playing and helping us improve what is out there.
